Configuration Management

Markus Raab

Institute of Information Systems Engineering, TU Wien

27.3.2018

Lecture is every week Wednesday 09:00 - 11:00.

```
06.03.2019: topic, teams
13.03.2019: TISS registration, initial PR
20.03.2019: other registrations, guest lecture
```

27.03.2019: PR for first issue done, second started,

HS: kleiner Schiffbau

03.04.2019: first issue done, PR for second

10.04.2019: mid-term submission of exercises

08.05.2019: (HS?)

15.05.2019: 22.05.2019: 29.05.2019:

05.06.2019: final submission of exercises

12.06.2019:

19.06.2019: last corrections of exercises

26.06.2019: exam

Popular Topics

5 error messages

5 auto-detection

4 user interface4 introspection

4 design

4 cascading

4 architecture of access

3 configuration sources

3 config-less systems2 secure conf

2 architectural decisions

1 push vs. pull

1 infrastructure as code

1 full vs. partial

1 convention over conf

1 CI/CD

0 documentation

Tasks for today

(until 27.03.2019 23:59)

Task

Description of homework as pull request in private repo. (Inside a folder for you, use GitHub name.)

Task

Description of teamwork (which application, which CM tool) as pull request in private repo. (Inside a folder for your team.)

Task

Fix at least one issue and write some text in at least one other issue.

Slides

- slide numbering: 02a is after 02
- old slides in same repo: always check date

Some misconfigurations

- studycode is Studienkennzahl
- same name twice in TALKS xml
- •

Task

How did these misconfigurations happened?

Tasks for next week

(until 03.04.2019 23:59)

Task

Fix misconfigurations in private repo.

Task

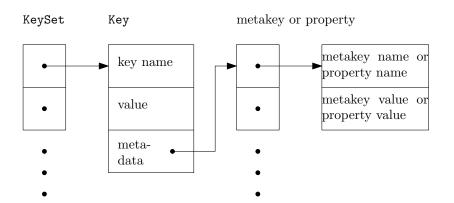

Fix feedback about homework/teamwork. Calculate complexity of your teamwork.

Task

First issue done, PR for second issue and write some text in at least one other issue (if 5 issues are not yet assigned to you).

KeySet (Recapitulation)

The common data structure between plugins:

Recapitulation

Q: "Which configuration systems/libraries/APIs have you already used or would like to use in one of your FLOSS project(s)?"

- command-line arguments (92 %, n = 222)
- environment variables (79 %, n = 218)
- configuration files (74 %, n = 218))

Semantics of Command-line Arguments (cont.)

- passed by main for a new process via (int argc, char ** argv)
- visible from other processes (e.g., via ps aux)
- could be passed along to subprocesses but hardly done
- need to be parsed by process
- portability: differences in parsing
- cannot be changed from outside (requires restart, no IPC)

Talk

Miruna Orsa Using XML in the day to day work life

Environment Variables

- Environment Variables
 - Requirements
 - Conclusion
- 2 Complexity
 - Trend
 - Calculation
 - Usage
- Configuration Specification
 - Why?

Semantics

- are also per-process (/proc/self/environ)
- are not visible from other processes
- are automatically inherited by subprocesses
- need to be parsed by process ([extern] char **environ)
 but API is provided (getenv)
- cannot be changed from outside (requires restart or an additional IPC mechanism)

getenv

- is widely standardized, including SVr4, POSIX.1-2001, 4.3BSD, C89, C99 [1],
- is supported by many programming languages, and
- enforces key=value convention.

Usage

- bypassing other configuration accesses (Q: 45 %)
- locating configuration files
- debugging and testing (Q: 55 %, S: 1,152, i.e. 43 %)
- sharing configuration settings across applications (Q: 53 %, S: 716, i.e. 47 %)
- for configuration settings unlikely to be changed by a user (Q: 20%)
- "even when it is used inside a loop" (Q: 2%)

Portability

- no separators for values defined
- case sensitivity problems
- often many environment variables for the same purpose: TMP, TEMP, or TMPDIR
- sometimes one environment variable for different purposes:
 PATH

Tas

What is wrong with the code in the book?

How can we deal with the many sources?

Requirement

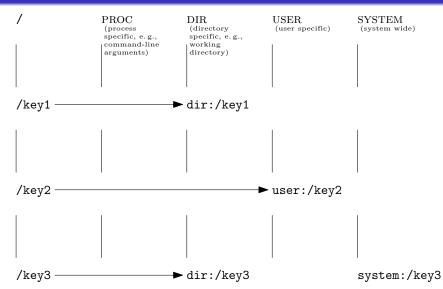

A configuration library must support all three popular ways for configuration access: configuration files, command-line options, and environment variables.

Example: Elektra

- includes library libopts
- which provides the function int elektraGetOpts (KeySet, argc, argv, environ, Key)
- which puts Keys in the proc namespace
- https://www.libelektra.org/tutorials/ command-line-options

What is a namespace?

Cascading

Requirements

Tasl

Discuss the differences of mounting and cascading with your neighbor.

User View

- command-line for trying out configuration settings
- environment variables for configuration settings within a shell
- configuration files for persistent configuration settings

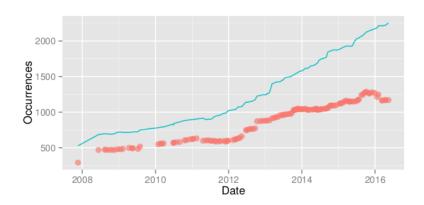

Conclusion

- three different configuration sources widely used
- all three used for different reasons but often for the same configuration settings
- many different configuration file formats
- abstractions: key-value, mounting, and cascading

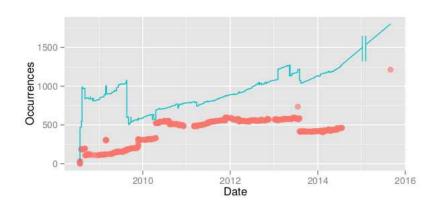

Complexity

- Environment Variables
 - Requirements
 - Conclusion
- 2 Complexity
 - Trend
 - Calculation
 - Usage
- Configuration Specification
 - Why?

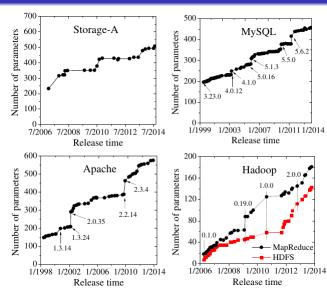

Trend Firefox

Trend Chromium

Trend Configuration Files

Xu et al. [8]

Types of Complexity

- complexity in access:
 - many different formats
 - non-uniformity
 - transformations
- configuration settings
 - number of settings s
 - number of values n
 - dependences between settings

Calculation of Complexity

Using enumerative combinatorics:

- number of configurations: n^s
- for N groups of different n and s (i.e., $n_1 ldots n_N$ with $s_1 ldots s_N$ occurrences):

$$\prod_{i=1}^{N} n_i^s$$

 more difficult to calculate (or unbounded) for dependences, module instantiations, arrays, . . .

Calculation of Complexity

Examples:

- 600 boolean settings in Apache httpd (let us assume n=2): $2^{600} \approx 10^{180}$
- \bullet 19 integer settings: $2^{32^{19}} = 2^{32 \cdot 19} = 2^{609} \approx 10^{183}$
- 2000 boolean settings in Firefox [4]: $2^{2000} \approx 10^{602}$

Calculation

Tas

Break.

Calculation of Complexity (cont.)

Examples:

• for 20 boolean and 20 enums with 5 possibilities:

$$2^{20} * 5^{20} = 10^{20}$$

- MySQL has 461 settings, of which 216 are non-simple types [8] (let us assume $n=\{3,20\}$): $3^{245}*20^{216}\approx 10^{397}$ (settings are explained in 5560 pages¹)
- an array with 1-20 boolean settings: 2^{20}

https://downloads.mysql.com/docs/refman-5.7-en.pdf

Calculation

Tas

Calculate complexity of your teamwork and add to PR.

See scripts/complexity.rb

Decision Tree

- configuration settings may depend on each other
- form a decision tree [2, 7]
- the decision tree is an instantiation of chosen configuration settings
- calculation only needs to consider instantiations which make a difference:
 - essential configuration complexity [5]

Harmful Defaults [8]

- Problem: Two major data losses on a dozen machines.
- Cause: Stayed with the default values of the data-path settings (e.g., dfs.name.dir, dfs.data.dir) which point to locations in /tmp. Thus, after the machines reboot, data losses occur.
 "One of the common problems from users." (from Cloudera)
- up to 53 % of misconfigurations is due to staying at defaults
- 17 % to 48 % of configuration issues are about difficulties in finding settings

Unnecessary Settings [8]

- Configuration Parameter:
 dfs.namenode.tolerate.heartbeat.multiplier
- Developers' Discussion: Since we are not sure what is a good choice, how about making it configurable? We should add a configuration option for it. Even if it's unlikely to change, if someone does want to change it they'll thank us that they don't have to change the code/recompile to do so.
- Real-World Usage:
 - No usage found by searching the entire mailing lists and Google.
 - No usage reported in a survey of 15 Hadoop users in UCSD.

Unnecessary Settings [8]

- 6 % to 17 % of settings set by majority
- up to 54 % are seldom set
- up to 47 % of numeric settings have no more than five distinct values

Reduction

Q: "Why do you think configuration should be reduced?"

- to simplify code maintenance (50 %),
- to prevent errors and misconfiguration (43 %),
- to provide better user experience (40 %),
- "I do not think it should be reduced" (30 %),
- because they prefer auto-detection (29 %)
 (with a possibility to override configuration settings: 32 %),
- "because use-cases which are rarely used should not be supported" (13 %),
- "never find time for this task" (9 %), and
- ullet "because only standard use-cases should be supported" $(1\,\%)$

Usage

Question

How to specify reduction strategies of configuration settings?

Answer

Configuration Specification

Configuration Specification

- Environment Variables
 - Requirements
 - Conclusion
- 2 Complexity
 - Trend
 - Calculation
 - Usage
- Configuration Specification
 - Why?

- without specification you and others do not even know which settings are available
- needed for any further techniques we will discuss
- essential for no-futz computing Holland et al. [3]
- the foundation for any advanced tooling like configuration management tools
- needed as communication of producers and consumers of configuration
